

A
Project Report on
AI Powered Mock Interview Platform

by

Shivam Patil	[33]
Kapil Shinde	[46]
Sandesh Dunbale	[11]
Bhavesb Vakare	[57]

Under the guidance of
Mrs. Poonam Dholi

Department of Computer Engineering
Matoshri College of Engineering and Research Centre,
Nashik-422105

SAVITRIBAI PHULE PUNE UNIVERSITY
2024-25

ACKNOWLEDGEMENT

First and the foremost I, express my deep sense of gratitude, sincere thanks and deep sense of Appreciation to project Guide **Mrs. Poonam Dholi** and seminar coordinate **Ms. Sonali Handore** Department of Computer Engineering, Matoshri College of Engineering and Research Center, Nashik. Your Availability at any time throughout the Semester, valuable guidance ,view, comments, critics, encouragement and support tremendously boosted this research work.

Again load and loads of thank to head Computer Engineering Department **Dr. Swati Bhavsar** for providing me the support I ever had .Your opinion, view , Comments and thoughts have been really helped me to improve my writing.

I like to express my sincere gratitude to Dr.G.K.Kharate, Principal, Matoshri College of Engineering and Research center, Nashik for proving the great platform to complete the this within the schedule time.

I am also Thankful to all the faculty member, Computer Engineering Department, Matoshri College of Engineering and Research Center, Nashik for giving comments for the improvement of work ,encouragement and help during completion of the thesis.

Last bit not least; I should say thanks from my bottom of heart to my family and friends for their never ending love, help and support in so many ways through all this time. Thank you so much.

Finally , I am thanking to MIGHTY GOD, who given me the courage confidence to not only this Dissertation work but also in bad difficult situation.

ABSTRACT

The AI-based Mock Interview system is designed to provide users with a comprehensive, automated interview preparation experience. The process begins with user registration, followed by a secure login to access the platform. Users are required to upload their resumes, which are then analysed to tailor the interview process. The system offers a multi-stage interview simulation, starting with a personality or HR interview, focusing on self-introduction and communication skills. This is followed by a technical interview, where users respond to oral technical questions related to their field. Additionally, users can take an aptitude test to assess their problem-solving and reasoning abilities. Upon completion, users receive a detailed report of their performance across all three sections, helping them identify strengths and areas for improvement, ultimately enhancing their interview readiness.

Keywords: Automated Interview Simulation, Resume Analysis, Personality and Technical Interview, Performance Feedback Report.

Performance Feedback Report

Chapter 1

Introduction

1.1 Overview

The AI-based Mock Interview system is a cutting-edge platform designed to help users prepare thoroughly for job interviews through automated simulations. After registering and securely logging in, users can upload their resumes, which the system analyzes to personalize the interview process. The system simulates a multi-stage interview experience, beginning with a personality or HR interview to assess communication and interpersonal skills. Following this, users engage in a technical interview, where they answer field-specific questions orally. The platform also offers an aptitude test to evaluate logical reasoning and problem-solving skills. After completing the process, users receive a comprehensive report detailing their performance in each section, highlighting strengths and areas for improvement to enhance their readiness for real interviews.

In addition to the core features, the system offers an intuitive user experience that adapts to the individual's field of expertise, providing customized feedback that aligns with industry standards. The detailed performance report not only helps users understand their current skill level but also offers actionable insights for further preparation. By combining AI-driven resume analysis, tailored interview questions, and a holistic evaluation process, the platform empowers users to build confidence and competence for their future job interviews.

1.2 Motivation

The motivation behind developing the AI-based Mock Interview system stems from the increasing competitiveness in the job market and the need for candidates to be well-prepared across various aspects of the interview process. Traditional interview preparation methods often lack personalized feedback, leaving candidates unsure of where they need to improve. By leveraging AI, this system offers a tailored, comprehensive interview simulation that not only mimics real-world interview scenarios but also provides detailed insights into a candidate's performance. This helps users build confidence, enhance their skills, and address specific weaknesses, ultimately increasing their chances of success in actual job interviews.

1.3 Problem statement

The traditional interview preparation process lacks personalized feedback and structured practice, leaving candidates unprepared for real-world interviews. Many individuals struggle with assessing their own communication skills, technical knowledge, and problem-solving abilities. Additionally, existing mock interview solutions are often limited in scope, failing to provide comprehensive evaluations. There is a need for an AI-driven system that can simulate multi-stage interviews, analyze resumes, and offer detailed performance feedback to enhance interview readiness.

1.4 Objectives

The objectives of the system are

- To provide a comprehensive, AI-driven mock interview experience that simulates real-world interview scenario.
- To analyze user resumes and tailor interview questions based on the candidate's field of expertise.
- To assess communication, technical, and problem-solving skills through multi-stage interviews and aptitude tests.
- To deliver detailed performance reports highlighting strengths and areas for improvement, enhancing users' interview preparedness.

1.5 Organization of report

This topic describes general overview about the residential management system , application,necessary and objective.

Literature Survey

This chapter describe about survey of all the literature based on many existing system have been studied which provide some drawbacks of their methods and algorithms.

Software Requirement Specification

This chapter describe problem description in detail. It contain the all solution used in the System. It gives the overall problem Statement of the project. It contains the hardware and software requirements of the project and also contain UML diagram that more elaborate the system.

Design of Rportal

This chapter introduces architecture of the system and module of the system. It also contain the registration, verification, authentication process and functioning of the system.DFD and UML diagram are explained in this chapter.

Prototype model of project

This chapter describe prototype model of system . This chapter discuss about how the system is implemented and a general overview of system working. It contains user interface of the project ,how the project look like , algorithm and steps code for better understanding how the system is implemented.

Conclusion

This chapter concludes the project.

Chapter 2

Literature Survey

This chapter discuss brief literature regarding the project. Literature survey is mainly used to identify information relevant to the project work and know impact of it within the project area. It defines as till yet how many surveys have been done knowledge of latest technology and implementation designs.

2.0.1 Literature Survey Table

Table 2.1: Literature Survey Table

Sr.No	Title	Year	Author	Details
1	Enhancing Job Interview Preparedness through Virtual Simulations	2021	Smith, J et.al	This project conducted an experiment with participants who practiced interviews using a virtual platform, resulting in significant improvements in confidence and performance compared to traditional preparation methods.
2	The Role of AI in Career Development	2022	Patel, R	This paper discusses the integration of artificial intelligence in career development tools, particularly mock interview platforms.

Society Problems:

In today's competitive job market, many job seekers face significant challenges in adequately preparing for interviews, which are critical for securing employment. Traditional preparation methods, such as reading interview tips or attending workshops, often fall short in providing personalized, actionable feedback. As a result, candidates struggle to identify their weaknesses in areas like communication, technical knowledge, and problem-solving skills. Moreover, access to mock interviews or professional coaching can be limited by geographic, financial, or time constraints, leaving many individuals underprepared for high-stakes interviews. This lack of accessible, comprehensive interview preparation contributes to missed employment opportunities

and reinforces the need for an innovative solution that provides tailored, affordable, and effective interview training for all.

Additionally, the growing reliance on technology in recruitment has heightened the expectations for job seekers to perform well in various stages of interviews, including technical assessments, aptitude tests, and personality evaluations. Many candidates, particularly those from underserved communities or with limited resources, find it difficult to practice these diverse skills in a structured and realistic manner. This disparity creates a significant barrier to equal employment opportunities, as those who cannot access personalized preparation are often at a disadvantage. Addressing this gap is crucial in promoting inclusivity and ensuring that all candidates, regardless of background, have the tools they need to succeed in a competitive hiring landscape. An AI-based mock interview system can bridge this divide by offering an accessible, adaptive platform that caters to individual needs and enhances interview readiness.

Furthermore, the rapid evolution of job roles, especially in technical and specialized fields, has made it increasingly difficult for candidates to stay up to date with the latest industry expectations. Many interview processes now include complex technical questions, scenario-based assessments, and behavioral evaluations that require both knowledge and practical experience. For candidates without access to proper mentorship or professional networks, preparing for these multifaceted interviews can be overwhelming. The lack of structured guidance often leaves candidates guessing about the types of questions they will face and how to approach them effectively. This not only affects their confidence but also diminishes their ability to showcase their true potential during interviews, ultimately leading to missed job opportunities.

Moreover, interview preparation services, such as professional coaching or in-person mock interviews, are often expensive and limited in availability. This restricts access for a large portion of job seekers, especially those from economically disadvantaged backgrounds or remote areas. The lack of affordable and scalable solutions for interview preparation contributes to widening inequality in the job market. An AI-based mock interview platform can help democratize access to high-quality interview training by offering a cost-effective, automated solution that is available anytime and anywhere. By providing real-time feedback and customized guidance, this system can empower individuals to improve their skills and increase their chances of securing employment, regardless of their socio-economic background.

Chapter 3

Software Requirement Specification

This chapter is about the software requirement specification. It contains the overall problem statement of the project and the hardware requirements, software requirements and functional and non-functional requirements of the project.

3.1 Software Specification

3.1.1 System Feature

- **Resume Analysis:** The system begins by analyzing the user's uploaded resume to tailor the interview process according to their qualifications and experience. By extracting key information such as skills, work history, and educational background, the system personalizes the questions asked during the interview. This ensures that each candidate is assessed on relevant topics, making the simulation more accurate and aligned with the industry standards for their field. It provides a strong foundation for the subsequent interview stages by focusing on the user's unique profile.
- **Personality and HR Interview Simulation:** In the first stage of the interview process, the system simulates a personality or HR interview that evaluates the candidate's communication skills, self-presentation, and interpersonal abilities. The system asks common HR questions, such as self-introductions and situational responses, assessing how well the user articulates their thoughts and handles typical HR interview scenarios. This stage helps users become more comfortable with verbal communication, a critical skill in interviews, while offering feedback on areas like clarity, tone, and confidence.
- **Technical Interview Simulation:** The system includes a technical interview phase where candidates respond to field-specific oral questions, allowing them to showcase their expertise. Questions are dynamically generated based on the user's resume and relevant industry standards, covering both theoretical knowledge and practical problem-solving skills. The system provides real-time feedback on the answers, helping users understand their strengths and gaps in technical knowledge. This feature ensures that candidates receive practice in technical assessments commonly found in real-world job interviews.

- **Aptitude Test:** In addition to the interview simulations, the system offers an aptitude test to evaluate users' problem-solving, logical reasoning, and analytical abilities. The test includes questions on numerical, verbal, and abstract reasoning, designed to simulate the types of assessments used by many companies during their hiring process. Users receive a score upon completion, which helps them gauge their performance compared to industry benchmarks. This feature is essential for identifying areas of cognitive strength and weakness, preparing candidates for both technical and non-technical roles.
- **Detailed Performance Report:** After completing the entire process, the system generates a detailed performance report that covers all stages of the mock interview, including the HR interview, technical interview, and aptitude test. The report highlights the user's strengths and areas for improvement, offering personalized feedback and actionable suggestions. It breaks down the candidate's performance across communication skills, technical knowledge, and problem-solving abilities, providing a comprehensive overview that helps users focus their preparation on weaker areas, ensuring a well-rounded interview readiness.

3.1.2 Database Requirements

SQLite : SQLite is a lightweight, serverless, and self-contained relational database management system that is widely used for applications requiring a simple and efficient database solution. It is particularly well-suited for mobile and embedded applications due to its small footprint and minimal configuration requirements. SQLite stores data in a single file on disk, making it easy to manage and transport. Its architecture allows for concurrent access from multiple users, though it is typically designed for scenarios where a single process handles database interactions. With support for standard SQL syntax, SQLite provides robust features such as transactions, triggers, and views, making it a versatile choice for developers seeking a reliable database solution for applications like the AI-based Mock Interview system, where ease of use and efficient data storage are paramount.

3.1.3 Hardware and Software Requirements

1. Hardware Requirements

- Processor core i3
- RAM 4gb
- HDD 500 gb

2. Software Requirements

- SQLite Database

Sqlite is an open source relational database management system(RDBMS).It uses a standard form of the well known SQL data language and works quickly and works will even with huge dataset

- Language: Python

Python is a popular programming language. It was created by Guido van Rossum, and released in 1991.

It is used for:

- (a) web development (server-side).
- (b) software development.

- Operating System: Windows 10 and above

Windows is the most widely used operating system for desktop and laptop computers. Develop by Microsoft, Windows preliminary runs on x86 based computers . Windows provides Graphical User Interface and desktop Environment in which application displayed in resizable,movable windows on screen.

3.1.4 Functional Requirements

REQ-1 :Users must be able to register and log in securely to access the system.

REQ-2 :The system must analyze user-uploaded resumes to tailor the interview questions.

REQ-3 :Users should be able to participate in a simulated personality or HR interview.

REQ-4 :The system must provide a technical interview simulation with field-specific questions.

REQ-5 :Users must receive a detailed performance report upon completing the mock interview process.

3.1.5 Non-Functional Requirements

REQ-1 : The system must ensure data security and user privacy during registration and login processes.

REQ-2 :The response time for the interview simulations should be under 2 seconds for a seamless user experience.

REQ-3 :The platform must support multiple devices, including desktops, tablets, and mobile phones.

REQ-4 :The system should be able to handle at least 1,000 concurrent users without performance degradation.

REQ-5 :The user interface must be intuitive and accessible, following usability standards for ease of navigation..

3.1.6 Specific Requirements

- A Workstation with Internet
- Python Django framework
- HTML5
- CSS3
- JavaScript
- Bootstrap 5.0
- Sqlite
- json

3.1.7 Timeline Chart

Table 3.1: Timeline chart

17	Linking of Modules	2 Day	05-02-2025	07-02-2025
18	Testing	3 Day	07-02-2025	10-02-2025

Chapter 4

Design of System

This chapter introduces architecture of the system and module of the system. It also contain the registration, verification, authentication process and functioning of the system.DFD and UML diagram are explained in this chapter.

4.1 System Architecture

Figure 4.1 The proposed AI-based Mock Interview system aims to revolutionize interview preparation by providing users with a comprehensive, interactive platform that simulates real-world interview scenarios. Upon registration, users can upload their resumes, which the system analyzes to customize the interview experience based on their qualifications and field of expertise. The system features a multi-stage interview process, beginning with a personality or HR interview that assesses communication skills, followed by a technical interview tailored to the user's background. Additionally, users can take an aptitude test to evaluate their problem-solving abilities. After completing the simulations, candidates receive a detailed performance report that highlights their strengths and areas for improvement, offering actionable insights to enhance their interview readiness. By leveraging AI technology, this system provides an accessible, cost-effective solution that empowers candidates from all backgrounds to prepare effectively for job interviews, ultimately increasing their chances of success in a competitive job market.

Figure 4.1: System Architecture

System architecture has this major blocks

- Resume Analyzer
- Self-Introduction Video Analysis
- Mock Test Module
- Aptitude Module
- Recommendation Module

Resume Analyzer

The Resume Analyzer feature automatically scans and evaluates user-uploaded resumes, identifying key skills, experiences, and qualifications relevant to specific job roles. It provides personalized feedback on formatting, language, and content, helping candidates enhance their resumes to align with industry standards and increase their chances of getting noticed by employers.

Self-Introduction Video Analysis

This feature allows users to record and submit self-introduction videos, which the system analyzes for clarity, confidence, and body language. By using AI-driven feedback, candidates receive insights on their presentation style and communication skills, enabling them to refine their self-presentation and make a strong first impression during interviews.

Mock Test Module

The Mock Test Module offers users the opportunity to participate in simulated interviews that mimic real-world scenarios, covering various topics and question types. This module assesses candidates' responses in a controlled environment, providing instant feedback on their performance and allowing them to practice and improve their answering techniques.

Aptitude Module

The Aptitude Module evaluates users' logical reasoning, problem-solving, and analytical skills through a series of timed assessments. By presenting a variety of questions across different categories, this module helps candidates identify their strengths and weaknesses, ensuring they are well-prepared for the aptitude tests commonly used in hiring processes.

Recommendation Module

The Recommendation Module analyzes the user's performance across various assessments and interviews to provide tailored suggestions for improvement and skill enhancement. It offers personalized recommendations for further resources, such as study materials or online courses, enabling candidates to focus on specific areas that will boost their overall readiness for job interviews.

4.2 Data Flow Diagrams

A data flow diagram(DFD) is a graphical representation of the flow of data through information system, modeling it's process aspects. A DFD is often used as a preliminary step to create an overview of the system without going into great detail ,which can later be elaborated.

4.2.1 DFD 0 Level daigram

A context diagram is a top level(also known as "Level 0") data flow diagram. Figure 4.2 shows a Level 0 diagram.It only contain one process node("Process 0") that generalizes the function of the entire system in relationship to external entities.

Figure 4.2: DFD Level 0 diagram

4.2.2 DFD 1 Level diagram

The Level 1 DFD shows how the system is divided into sub-system(processes),each of which deals with one or more of the data flows to or from an external agent and which together provide all of the functionality of the system as a whole. Figure 4.3 shows a Level 1 diagram.

Figure 4.3: DFD Level 1 diagram

4.3 UML Diagrams

4.3.1 Use Case Diagram

Actor:

A coherent set of roles that users of use cases play when interacting with the use cases.

Use case:

UML stands for Unified Modeling Language. UML is a language for specifying visualization and documenting system. This is the step while developing any product after analysis. The goal from this is to produce a model of the entities involved in the project which later need to be built. The representation of the entities that are to be in the product being developed need to be designed.

Figure 4.4: Usecase diagram

4.3.2 Sequence Diagram

Sequence diagram and collaboration diagram are call INTERACTION DIAGRAM. An interaction diagram shows an interaction , consisting of set of object and their relationship including the message that may be dispatch among them

sequence diagram simply depicts interaction between objects in a sequential order i.e. the order in which these interactions take place. We can also use the terms event diagrams or event scenarios to refer to a sequence diagram. Sequence diagrams describe how and in what order the objects in a system function. Figure 4.5 shows a Sequence Diagram.

Figure 4.5: Sequence Diagram

4.3.3 Class Diagram

Class diagram are the most common diagrams used in UML. Class diagram consists of classes, interfaces, association and collaboration. It basically represent the object oriented view of a system which is static in nature. Figure 4.6 shows a class diagram.

Figure 4.6: Class Diagram

4.4 Modules of System

4.4.1 Resume Analyzer

The Resume Analyzer feature automatically scans and evaluates user-uploaded resumes, identifying key skills, experiences, and qualifications relevant to specific job roles. It provides personalized feedback on formatting, language, and content, helping candidates enhance their resumes to align with industry standards and increase their chances of getting noticed by employers.

Function Of Module:

GEExtracts key information from the uploaded resume, identifies relevant skills, experiences, and qualifications, and customizes interview questions based on the candidate's profile.

Input

User-uploaded resume in standard formats

Output

Customized interview questions and personalized feedback on resume content, format, and alignment with industry standards.

Working

The system scans the resume using natural language processing to identify critical components. It analyzes the extracted information to align with job requirements and generates relevant interview questions for the candidate.

4.4.2 Personality and HR Interview Simulation

This feature allows users to record and submit self-introduction videos, which the system analyzes for clarity, confidence, and body language. By using AI-driven feedback, candidates receive insights on their presentation style and communication skills, enabling them to refine their self-presentation and make a strong first impression during interviews.

Function Of Module:

Simulates HR interview scenarios, assesses communication skills, and provides feedback on self-presentation and interpersonal abilities.

Input

User responses to pre-defined HR questions during the simulated interview.

Output

Feedback on clarity, tone, confidence, and overall communication effectiveness

Working

The system presents a series of common HR questions, prompting users to respond verbally. It uses voice recognition and sentiment analysis to evaluate the quality of responses and provide real-time feedback.

4.4.3 Technical Interview Simulation

Test Module offers users the opportunity to participate in simulated interviews that mimic real-world scenarios, covering various topics and question types. This module assesses candidates' responses in a controlled environment, providing instant feedback on their performance and allowing them to practice and improve their answering techniques.

Function Of Module:

Conducts a simulated technical interview with dynamic questions tailored to the user's field of expertise, assessing theoretical knowledge and practical skills

Input

User responses to field-specific technical questions.

Output

Real-time feedback on technical knowledge and performance, along with a summary of strengths and gaps.

Working

The system generates questions based on the user's resume and relevant industry standards. It evaluates answers using predefined criteria and provides instant feedback to help users understand their technical proficiency.

4.4.4 Aptitude Test

The Aptitude Module evaluates users' logical reasoning, problem-solving, and analytical skills through a series of timed assessments. By presenting a variety of questions across different categories, this module helps candidates identify their strengths and weaknesses, ensuring they are well-prepared for the aptitude tests commonly used in hiring processes.

Function Of Module:

Administers an aptitude test to evaluate problem-solving, logical reasoning, and analytical skills across various question types.

Input

User-selected responses to aptitude test questions, including numerical, verbal, and abstract reasoning.

Output

A score reflecting the user's performance, along with a breakdown of strengths and weaknesses.

Working

The system presents a series of timed questions in different categories. Upon completion, it calculates the user's score and compares it to industry benchmarks, offering insights into cognitive capabilities.

4.4.5 Recommendation

The Recommendation Module analyzes the user's performance across various assessments and interviews to provide tailored suggestions for improvement and skill enhancement. It offers personalized recommendations for further resources, such as study materials or online courses, enabling candidates to focus on specific areas that will boost their overall readiness for job interviews.

Function Of Module:

Generates a comprehensive performance report summarizing results from the HR interview, technical interview, and aptitude test, highlighting strengths and areas for improvement.

Input

Performance data from all stages of the mock interview process.

Output

A detailed report that includes scores, feedback, and personalized recommendations for further improvement.

Working

The system compiles data from each assessment stage, analyzes performance metrics, and organizes the information into a clear and actionable report, guiding users on how to enhance their interview readiness.

Chapter 5

Conclusions

We have implemented login system and resume analysis module and we are looking forward to implementation of other modules in the next semester.
